Summary

Senior backend engineer (C#, .NET) focused on resilient, low-latency distributed systems. Experienced in decomposing monoliths into deployable microservices on Azure, establishing PR-gated CI/CD, and leading cross-team delivery for production-critical endpoints.

Education

Sheffield Hallam

Games Software Development

Experience

TransUnion

Senior Software Engineer

Jan 2021 – Present

Led backend modernisation and developer-productivity initiatives across multiple business domains; primary focus .NET and Azure.

- Increased release cadence (monthly -> daily) by decomposing a legacy monolith into domain-aligned ASP.NET Core microservices and introducing PR-gated CI/CD and trunk-based practices; trade-off: accepted additional operational complexity and mitigated risk with automated integration tests and feature flags. Post-migration uptime on peak traffic events at 99.9%.
- Cut CI/CD pipeline time ~50% via build/test parallelisation and pipeline redesign; shortened lead time merge->prod and accelerated feedback without raising post-release defects.
- Modernised A/B tooling, reducing per-comparison runtime by ~15 minutes and shrinking validation windows by hours — enabled more frequent, data-driven experiments.
- Engineered AI-assisted tech-debt workflow: weekly LLM scans propose low-risk PRs (human-review gated), reducing manual triage and speeding remediation of recurring maintenance items.
- Leadership & influence: mentored 3 engineers, onboarded 2 cross-functional teams, acted as acting tech lead for a month, and took part in hiring/interviews; regularly aligned technical trade-offs with product and ops stakeholders.

CallCredit

Software Engineer

Jan 2016 – Jan 2021

Delivered platform and tooling improvements enabling the cloud migration and microservices re-architecture.

- Led TFVC -> Git migration and introduced trunk-based development to support faster merges and continuous delivery.
- Introduced EF Core patterns and telemetry on slow queries to prioritise fixes and improve troubleshooting speed.
- Implemented SpecFlow-based acceptance tests gated in CI and helped roll out OAuth/OpenID Connect for secure API flows.

Projects

SyncIt (Blazor)

Real-time multi-user queue for synchronous music sessions. Implemented Spotify APIs with ASP.NET Core and real-time sync logic; focused on fairness, rate limiting and concurrency control.

Skills

🔗 Languages & Frameworks

C#, .NET (6/8/10), ASP.NET Core, hands-on training), Azure Blazor
DevOps, AWS (hands-on training), Microsoft Azure (App Services / Azure SQL / KeyVault / APIM)

🔗 Cloud & Infrastructure

Docker, Kubernetes (AKS - Microservices, Domain-Driven Design, Event-Driven Architecture, EF Core, CleanArchitecture

🔗 Architecture & Data

Microservices, Domain-Driven Design, Event-Driven Architecture, EF Core, CleanArchitecture

🔗 Quality & Observability

CI/CD, MsTest, Reqnroll, Application Insights, OpenTelemetry (hands-on training)

🔗 Security & Ops

OAuth / OpenId Connect, OWASP, Incident response & postmortems
