Summary

Passionate senior software engineer who genuinely enjoys building high-quality, maintainable systems — and the discipline required to keep them that way. I've extracted and owned bounded contexts from monoliths, shortened release cycles, and raised the bar on CI/CD along the way. I love learning, building knowledge bases, and leaving codebases cleaner than I found them.

Experience

TransUnion

Jan 2021 – Present

Senior Software Engineer

Led backend modernisation and developer productivity initiatives across multiple business domains, primarily using .NET and Azure.

Primary skills used: C# 14, .NET 8/10, ASP.NET Core, Azure Service Fabric, KeyVault, Application Insights, API Management, .NET Aspire, Service Bus, C++, OpenApi, Octopus Deploy, MySql, TDD, DDD and BDD

- Increased release cadence from quarterly to weekly by decomposing a C++/VB.NET/C# monolith into domain-aligned .NET microservices within a Service Fabric cluster.
- Championed PR-gated CI/CD and trunk-based development practices, reducing downstream breaking-change issues and improving release confidence.
- Balanced the added operational complexity of microservices through automated integration testing, API versioning, and feature flags.
- Reduced CI/CD pipeline runtime by ~50% through build/test optimisation and pipeline redesign, shortening feedback loops and merge-to-production time.
- Modernised A/B comparison tooling by replacing a legacy tool with a new one, built as a series of CLI tools with a bundled Blazor report for easy comparisons by QA, containing features such as accepted difference handling, ignore rules, and PII data masking. Cutting comparison runtime by ~30 minutes and reducing validation effort by several hours per release.
- Engineered an automated AI workflow that utilizes the Azure DevOps REST API to extract tech debt items, transform them into structured LLM prompts, and execute autonomous resolution via a custom background CLI tool.
- Mentored engineers regularly, onboarded two cross-functional teams, including our global teams. Acted as tech lead for a month, contributed to hiring interviews, and regularly aligned technical implementation with product and operational stakeholders.
- Resolved a challenge with our local development and testing practises by engineering a .NET Aspire solution for our distributed system to help improve local development across our connected services.
- Supported out-of-hours live releases, such as SQL Server migrations and new product releases.

CallCredit

Jan 2016 – Jan 2021

Software Engineer

Delivered platform and tooling improvements enabling the cloud migration and microservices re-architecture.

Primary skills used: C#, ASP.NET (many versions), C++, COM+, VB6, Azure KeyVault, Application Insights, MySql

- Provided care and maintenance to a SOAP, COM+ live system.
- Led TFVC -> Git migration and introduced trunk-based development to support faster merges and continuous delivery.
- Introduced EF Core patterns and telemetry on slow queries to prioritise fixes and improve troubleshooting speed.
- Implemented SpecFlow-based BDD tests across various domains.
- Contributed to the rollout of OAuth/OpenID Connect for securing our APIs.
- Led an interactive Game Jam, building a tower defence game using MonoGame.NET, that could be played by programming against an API running alongside the game.
- Took part as a buddy in the graduate programme, offering support and guidance to new graduates.

Education

Sheffield Hallam

- I created an interactive guide for a video game, making use of APIs to retrieve the latest game data, built with Unity.
- Within a team of 4 engineers, I helped build an interactive children's book using C# and Unity, containing accessibility features such as the use of text-to-speech libraries and interactive zooms.
- Within a team of engineers and artists, I helped develop a PlayStation 4 game using Sony's PhyreEngine.
- Gained experience across a variety of languages such as C, C++, x86 Assembly, HTML/CSS, and JavaScript.

Projects

SyncIt (Blazor)

Jan 2021 – Deprecated

Real-time multi-user queue for synchronous music sessions. Implemented Spotify APIs with Blazor, ASP.NET Core, SignalR and real-time sync logic.

<https://syncityo.com>

Front-end hobby projects

2023 - Present

To build knowledge and experience on popular front-end stacks, I've built a few websites, such as a family member's portfolio site, a wedding site, and my own portfolio site using React, TypeScript, Tailwind CSS, Next.js, Supabase, Vite, and Zustand.

Battle Arena Manager

2024 - Present

Ongoing game project, building using [GODOT.NET](#) and C#.

Skills - Core

Languages & Frameworks	Architecture	Data & State	Cloud & DevOps	Testing, Sec & Ops
 C#, .NET (6/8/10), ASP.NET Core, Blazor, OpenApi	 Microservices, Domain-Driven Design, Event-Driven Architecture, Clean Architecture, CQRS, Distributed Systems, AI Agent Development	 Azure SQL, EF Core, CosmosDB, MySQL	 CI/CD, Docker, Key Vault, App Services, API Management, Azure DevOps, Service Fabric, Azure Service Bus, GitHub Actions, Octopus Deploy	 MsTest, Reqnroll, SonarQube, App Insights, Open Telemetry, OAuth/OIDC, CheckMarx, Seeker, Incident Response

Skills - Secondary

Languages & Frameworks	Architecture	Data & State	Cloud & DevOps
 Kotlin, React, TypeScript, C++, VB, JavaScript, Next.js, Tailwind CSS	 Modular Monolith	 Redis, Postgres	 AWS, GCP, K8s, Supabase
